Application of Eugen ALDEA et al. Serial No. 10/584,145 Filed: 03/2902007 Response

LISTING OF THE CLAIMS

- 1. (Previously Presented) Method for controlling a glow discharge plasma in a gas or gas mixture under atmospheric conditions, in a plasma discharge space comprising at least two spaced electrodes, wherein at least one plasma pulse is generated by applying an AC plasma energizing voltage to said electrodes causing a plasma current and a displacement current, said at least one plasma pulse comprising an absolute pulse maximum, said method comprises the step of controlling said energizing voltage such that a relative decrease of said displacement current is provided before said pulse maximum.
- 2. (Original) Method according to claim 1, further comprising a step of synchronizing said relative decrease of said displacement current with the onset of said plasma pulse.
- 3. (Previously Presented) Method according to claim 1, wherein said relative decrease of said displacement current is provided within a time interval, wherein said time interval is of an order of a microsecond, preferably fractions of a microsecond.
- 4. (Original) Method according to claim 3, wherein said relative decrease of said displacement current within said time interval is at least 100%.
- 5. (Previously Presented) Method according to claim 1, wherein said relative decrease of said displacement current results in a relative negative value for said displacement current.
- 6. (Previously Presented) Method according to claim 1, wherein before said pulse maximum said energizing voltage is controlled in a manner such that a second derivate of said energizing voltage over time is proportional and of opposite sign to a first derivative over time of plasma current.

- 7. (Previously Presented) Method according to claim 1, wherein at least one of said electrodes is covered by a dielectric material.
- 8. (Original) Method according to claim 7, wherein said dielectric material has a secondary electron emission between 0.01 and 1.
- 9. (Previously Presented) Method according to claim 1, wherein said plasma is operated at a voltage that is a few percent higher than the minimum voltage necessary for maintaining said plasma.
- 10. (Previously Presented) Apparatus for controlling a glow discharge plasma in a discharge space having at least two spaced electrodes, means for introducing in said discharge space a gas or gas mixture under atmospheric conditions, a power supply for energizing said electrodes by applying an AC plasma energizing voltage to said electrodes for generating at least one plasma pulse and causing a plasma current and a displacement current, said at least one plasma pulse comprising an absolute pulse maximum, and means for controlling said plasma, said means for controlling said plasma are arranged for controlling said energizing voltage such that a relative decrease of said displacement current is provided before said pulse maximum.
- 11. (Original) Apparatus according to claim 10, further comprising means for synchronizing said relative decrease of said displacement current with the onset of said plasma pulse.
- 12. (Previously Presented) Apparatus according to claim 10, wherein at plasma generation said means for controlling said plasma are arranged for decreasing said displacement

current to a value relatively less than a value of said displacement current before plasma breakdown.

- 13. (Previously Presented) Apparatus according to claim 10, wherein said means for controlling said plasma are arranged for controlling said energizing voltage in a manner such that at plasma generation said relative decrease of said displacement current is at least 100% and is provided in fractions of a microsecond.
- 14. (Previously Presented) Apparatus according to claim 10, wherein said means for controlling said plasma are arranged for providing a first derivative over time of an absolute value of said energizing voltage and for sharply decreasing said first derivative over time of said absolute value of said energizing voltage at plasma generation.
- 15. (Previously Presented) Apparatus according to claim 10, wherein said means for controlling said plasma are arranged for controlling said energizing voltage in a manner such that, before said pulse maximum, a second derivate of said energizing voltage over time is proportional and of opposite sign to a first derivative over time of plasma current.
- 16. (Original) Apparatus according to claim 15, wherein said first derivative of said plasma current is provided by inductor means connected in series with said electrode or electrodes of said discharge space.
- 17. (Previously Presented) Apparatus according to claim 10, wherein said means for controlling said plasma comprise pulse generator means providing voltage pulses superimposed at said energizing voltage at said electrodes.

- I8. (Original) Apparatus according to claim 17, wherein said pulse generator is formed by a power amplifier, having input or control terminals which are connected to means for sensing plasma current, and wherein output terminals of said amplifier are connected in series with said power supply means and said electrodes for superimposing a voltage pulse at said energizing voltage.
- 19. (Previously Presented) Apparatus according to claim 10, wherein said means for controlling said plasma comprise electronic inductor circuitry.
- 20. (Previously Presented) Apparatus according to claim 10 wherein said electrodes are spaced over a distance of between 0.01 mm and 3 cm.
- 21. (Previously Presented Currently Amended) Apparatus according to claim 10, wherein said gas is selected from a group comprising Helium, Argon, Nitrogen, Air, Oxygen, Carbon Dioxide, Ammonia and a mixture comprising any of said gasses of said group.
- 22. (Previously Presented Currently Amended) Apparatus according to claim 10, wherein said gas is a mixture of a noble gas and a chemically active gas.
- 23. (Previously Presented Currently Amended) Apparatus according to claim 10, wherein said AC power supply means are arranged for energizing said electrodes with an energizing voltage at a frequency between 10 kHz and 50 MHz.
- 24. (Previously Presented) Device for treating a surface of a substrate, comprising an apparatus for controlling a glow discharge plasma in a discharge space having at least two spaced electrodes, means for introducing in said discharge space a gas or gas mixture under atmospheric conditions, a power supply for energizing said electrodes by applying an AC plasma
